## Math Circle 1 Algebra 1 8/13/2024 1:50-3:00

Cyrus, Marc and Dar (Rooz crashed the first 10 minutes)

This year we are going to start with an Algebra book from someone I know from NCTM conferences. I always wanted to use his book as it introduced Algebra Lab Gear that is a great method to make Algebra more concrete by using a manipulative. The book is designed for Algebra 1 and it was meant to be covered in one academic year generally in 9<sup>th</sup> or 10<sup>th</sup> grade but the consensus is that it could not be covered in 1 year. I intend to use the final section of some of the chapters that are titled: “Essential Ideas”. I am attaching the one for the first chapter. This is also the link for the book in PDF [“Algebra: Themes, Tools and Concepts”](#) that you may wish to download.

We first played a simple game that I have invented using Lab Gear. We played it as a community game. Rooz also crashed the party and played as he knows it. You roll two dice that their product will give you the values 1 or 5 or an expression with  $x$  and  $y$  ( $x$ ,  $y$ ,  $x^2$ ,  $y^2$ ,  $xy^2$ ,  $x^2y$ ,  $x^3$ ,  $y^3$ ) then you have to put that piece on the following board. It was good for Marc as he had not seen Lab Gear before (I think).

Then Cyrus and Marc covered the first 12 problems of the Essential Ideas for the first chapter together. It went well and they discussed and setup the problems together. Finally they got a little stuck of problems 14 and 15 that go together. We may finish the rest of the problems next time or just discuss them. Their worksheets are below. As always Cyrus was encouraged to work faster and Marc to use better penmanship. They have improved from last year and we discussed the fact that they needed to show all the steps otherwise they may not get full credit on exams. Marc must have heard this in class because he supported it strongly.

It was a long session and a very good start for the Math Circle for 2024-2025.

1. 15
2. 75
3. 45
4.  $x^3 + x^2 + 3x + 5 = 8 + 4 + 6 + 5 = 23$
5.  $x^2y + x^3 + xy + x + 5 = v$ 
  - a.  $x=0$   $y=2$   $v=0+0+0+0+5=5$
  - b.  $x=5$   $y=1$   $v=25+125+5+5+5=165$
  - c.  $x=2$   $y=3$   $v=12+8+6+2+5=33$
6.  $xy^2 + y^2 + 2y + x^2 + 3 = z$ 
  - a.  $z=0+4+4+0+3=11$
  - b.  $z=5+1+2+25+3=35$
  - c.  $z=18+9+6+4+3=40$
7.  $2y^2 + 2x + 3$
8.  $x^2 + 3x + 3$
9.  $3x^2 + 2y + 5$
10.  $3x^2 + 2x + 5$
11.  $3x^2 + 2xy + y$
12.  $x^3 + 3x^2 + 8x + 9$
13.
  - a.  $x^2 \cdot x = x^3$
  - b.  $3x \cdot x = 3x^2$
  - c.  $x^2 \cdot x^2 \cdot x^2 \cdot x^2 = x^8$
  - d.  $y^6 \div y^6$
  - e.  $2xy + 3xy = 5xy$

1. 15
2. 75
3. 45
4.  $x^3 + x^2 + 3x + 5$ 
  - a.  $x=0$   $y=2$   $v=5$
  - b.  $x=5$   $y=1$   $v=165$
  - c.  $x=2$   $y=3$   $v=33$
5.  $x^2y + x^3 + xy + x + 5 = v$ 
  - a.  $x=0$   $y=2$   $v=5$
  - b.  $x=5$   $y=1$   $v=165$
  - c.  $x=2$   $y=3$   $v=33$
6.  $xy^2 + y^2 + 2y + x^2 + 3 = z$ 
  - a.  $z=11$
  - b.  $z=35$
  - c.  $z=40$
7.  $2y^2 + 2x + 3$
8.  $x^2 + 3x + 3$
9.  $3x^2 + 2y + 5$
10.  $3x^2 + 2x + 5$
11.  $3x^2 + 2xy + y$
12.  $x^3 + 3x^2 + 8x + 9$
13.
  - a.  $x^2 \cdot x = x^3$
  - b.  $3x \cdot x = 3x^2$
  - c.  $x^2 \cdot x^2 \cdot x^2 \cdot x^2 = x^8$
  - d.  $y^6 \div y^6$
  - e.  $2xy + 3xy = 5xy$

## Math Circle 2 Algebra 2 8/21/2024 1:50-3:00

Cyrus, Marc and Dar

We continued with the problems in the first chapter that are titled: “Essential Ideas” from the PDF [“Algebra: Themes, Tools and Concepts”](#).

I had prepared a table for problems 13, 14, 15, 16 and 17 to keep them moving. Cyrus and Marc had decided to use their own numbering system so it would not correspond exactly to the handout from the book.

With the tables that I made for them they had an easy time solving problems 13 to 16. These exercises helped them with adding and multiplying variables and coefficients. They worked well together. I have attached their work below.

Next, we did problems 17 and 18 that dealt with order of operations and they both used the lab gear and could see how parenthesis should be used and were used.

Next, they worked on problems 19 to 21 that dealt with Area and multiplication of variables and constants. They used the lab gear a lot and had a lot of fun with these problems. In particular for problems 20 and 21 where they had to make the rectangles and then find the missing side(s). We discussed the four quadrants that Marc was familiar with and Cyrus had seen for the first time. Cyrus then figured out with help from Marc that if he made both multiplicands negative the result would be the same as with them positive

It was a great session that was both hands on and also, they did a lot of introductory algebraic operations on paper. As you can see my(our) continuous encouragement of Marc to write more clearly is paying off and he is more and more careful. However, Cyrus goes at his own speed, and I must see how I can get him to go a bit faster. They work well together, and I enjoy watching them work together. I did a short video that I will attach on maybe just text to you.

13, 14

| $x, y$ | $2 + x + y$ | $2 + xy$ | $2x + y$ | $2xy$ |
|--------|-------------|----------|----------|-------|
| 1, 1   | 4           | 3        | 3        | 2     |

16

| $x, y$ | $x + y^2$ | $x^2 + y$ | $x^2 + y^2$ | $(x + y)^2 = x^2 + 2xy + y^2$ |
|--------|-----------|-----------|-------------|-------------------------------|
| 1, 1   | 2         | 2         | 2           | 4                             |
| 1, 2   | 5         | 3         | 5           | 9                             |
| 2, 3   | 11        | 7         | 13          | 25                            |

14. a. 1

b.  $y=0$   $2+5y > (2+5)y$  because  $2 > 0$

c.  $y=2$   $2+5y < (2+5)y$  because  $14 > 12$

15. a.  $3 \times 5 = 15$

b.  $3x$

c.  $3 \cdot (x+5) = 3x+15$

d.  $x \cdot (x+5) = x^2+5x$

16. a.  $4 \cdot x = (-4) \cdot (-x) = 4x$

b.  $(-4) + (2x) + 2x = 2+x \cdot 4x = (-)(4+2x) = (-4) \cdot 2x = 4x^2 + 8x$

c.  $x+y \cdot 4x+3 = 6x^2+3xy+9x$

17. a.  $x \cdot (x+y) = x^2+xy$

b.  $(y+1)5 = 5y+5$

c.  $(2x+3)y = 2xy+3y$

d.  $2x \cdot (3x+y+2) = 6x^2+4x+2xy$

14 a. 1

b  $2 > 0$

$$\begin{array}{l} x=0 \quad 2+3y \quad 7y \\ = 2+0 \quad = 0 \\ = 2 \end{array}$$

c.  $14 > 12$

$$\begin{array}{l} y=2 \quad 2+10 \quad 7y \\ = 12 \quad = 14 \end{array}$$

15. a.  $3(5) = 15$

b.  $3(x) = 3x$

c.  $3(x+5)$

$$= 3x+15$$

$$x \cdot (x+5)$$

d.  $= x^2 + 5x$

a.  $4 = x \cdot 4 \cdot (-1) = 4x$

b.  $4x^2 + 8x$

$$4 + (2x) \cdot 2x = 4 + x \cdot 4x = 4 + 4x^2 = 4x^2 + 8x$$

c.  $x + y \cdot 4x + 3 = 6x^2 + 4xy + 9x$

$$16. x(x+y) = x^2 + xy$$

$$5(y+1) = 5y + 5$$

$$y(x+3) = 2xy + 3y$$

$$2x(y+3x+2)$$

Math Circle 3 Algebra 3 8/29/2024 1:50-3:00

Cyrus, Marc and Dar

We finished the problems in the first chapter that are titled: “Essential Ideas” from the PDF [“Algebra: Themes, Tools and Concepts”](#) and started the problems on the second chapter “Essential Ideas” mostly dealing with the concept of the negative sign and its 3 meanings.

Problems 19-22 in the first chapter deal with Area and multiplication of constants and variables and expressions. Cyrus and Marc used the Algebra Lab Gear (ALG) first and then wrote down the answers. For some of the problems they wanted to just skip the ALG and just write the answers, but I encouraged them to use the ALG either before or if not after they had found the answers to check their results. This gives them a much better understanding of how the multiplication of variables and expressions works. This is a more time-consuming effort but well worthed. Even in Marc work on paper you can see that he has slowed down. Cyrus goes at his own speed, and I have not been able to encourage him to write a little faster and maybe sloppier.

Next, we started the discussion for the second chapter about negative sign and its 3 meanings: negative number, opposite value, Subtraction. They did problems 1, 2, 3 and used the special pages where the negative numbers and variables go into a separate part.

It was a good session, and they worked together well and discussed what had to be done with me, when they were using the ALG. They keep asking to do Logarithms again so I may do a review of what they did last time in their next session.

Negative variables and numbers go into the rounded square. Equivalent values and variables from inside and out side of the square cancel each other.

14. a. 1

b.  $y=0$   $2+5y > (2+5)y$  because  $2 > 0$

c.  $y=2$   $2+5y < (2+5)y$  because  $14 > 12$

15. a.  $3 \times 5 = 15$

b.  $3x$

c.  $3 \cdot (x+5) = 3x+15$

d.  $x \cdot (x+5) = x^2+5x$

16. a.  $4 \cdot x = (-4) \cdot (-x) = 4x$

b.  $(-4) + (2x) + 2x = 2+x \cdot 4x = (-)(4+2x) = (-4) \cdot 2x = 4x^2 + 8x$

c.  $x+y \cdot 4x+3 = 6x^2+3xy+9x$

c.  $2$  d.  $x$   
e.  $-x-2$  f.  $-x+2$

3. a.  $(y^2 + \cancel{x^2} - \cancel{3x}) + (\cancel{x} + 3x^2 + \cancel{x^2})$   
 $y^2 + 3x^2 + 2y$

b.  $x + (25 - \cancel{yx} - y^2) + (\cancel{xy} - y - \cancel{x})$   
 $-y^2 - y + 25$

c.  $(\cancel{4} - x^2 - \cancel{5x}) - \cancel{3x} - \cancel{2}$   
 $-x^2 - 8x + 2$

## Math Circle 4 Logarithms 9-11-2024 1:50-3:30

Cyrus, Marc and Dar

As the boys have been asking about a repeat of a session on the Logarithms I decided to repeat what we had done with the exercises from the [Logarithm Fundamentals Video from 3 Blue one Brown Live](#). I watched the live myself and did the exercises and realized how much I had to review. I chose parts of the live, approximately 30, minutes and the rest of the time we did the exercises. As the live goes too slow for them to watch all of it I did some of the explanations myself and made a single sheet with all the questions for them.

They wanted all the rules to begin with, but I refused to give it to them and wanted them to discover the rules by doing the exercises that they did. I basically wanted to do what Grant did in the video and gave the same questions to them I also added some myself. Starting with the basic fact that in base 10, Logarithms count zeros when you evaluate the powers of 10. I had already mentioned that I called Logarithms the “Power Spitter Functions” or simply “Spitters” and they liked my name better. Also spitting can be done for all bases for the powers of the base so it is more general.

I focused the session on the use of the Logarithmic scale and started with Grants explanation on how the COVID cases could be predicted using a Logarithmic scale. I had them watch this part of the Video and we discussed it. In particular the fact that if the growth of some thing is multiplicative you will end up with an exponential function and using the Logarithmic scale would allow you to predict values as opposed to a linear scale.

I also had them look and discuss the 99.9 divisibility chart by primes in the Pascal’s triangle that they had seen last time and try to make those estimates for other primes, say 17 is impossible with a linear scale but strait forward with the Logarithmic scale.

We also looked at the Richter Scale chart again and how at each step the equivalent force measured in TNT equivalent grows by a factor of 32 so it grows by a factor of 1K each 2 steps. We did not get to look at how this was exactly related to the change of base in logarithms, but we may discuss it next time.

Next. they did the problems on the sheet and figured out what rule applied to each one. I will share the rules with them next time and review them. I think they have a much better understanding of these rules and why Logarithms are important now.

We also watched and discussed the triangle method of relating power, root and logarithm as inverse functions.

It was a very good session, and they got to play some foosball at the end but forgot to cover the table afterwards.

$10^3 = 1,000$   

$\sqrt[3]{1,000} = 10$   

$\log_{10}(1,000) = 3$   

17:02 / 1:34:21

Which of the following is true?

☐  $\log(1,000 \cdot x) = 3\log(x)$

☐  $\log(1,000 \cdot x) = \log(x)^3$

☒  $\log(1,000 \cdot x) = 3 + \log(x)$

☐  $\log(1,000 \cdot x) = 3^{1000}$

☐ None of the above

Which of the following is true?

☒  $\log(e^n) = n \log(x)$

☐  $\log(x^n) = (\log(x))^n$

☐  $\log(x^n) = n + \log(x)$

☐  $\log(x^n) = \log(n) \cdot \log(x)$

☐ None of the above

Which of the following is true?

☐  $\log_a(b) = -\log_a(a)$

☒  $\log_a(b) = 1/\log_b(a)$

☐  $\log_a(b) = 1 - \log_a(a)$

☐  $\log_a(a) = \log_a(1/b)$

☐ None of the above

Given the fact that  $2^{10} \approx 1,024$ , which is approximately 1,000, which of the following is closest to being true?

☒  $\log_2(10) \approx 0.3$

☐  $\log_{10}(2) \approx 0.3$

☒  $\log_2(10) \approx 1.3$

☐  $\log_{10}(2) \approx 1.3$

Which of the following is true?

☒  $\log_a(b) \cdot \log_a(a) = \log_a(a)$

☒  $\log_a(b) \cdot \log_a(a) = \log_a(b)$

☐  $\log_a(c) \cdot \log_a(c) = \log_a(a)$

☐  $\log_a(c) \cdot \log_a(b) = \log_a(a)$

☐ None of the above

Using the approximation  $\log_2(10) \approx \frac{10}{3}$ , which of the following is (approximately) true?

☐  $\log_2(x) = \frac{10}{3} + \log_{10}(x)$

☐  $\log_2(x) = \log_{10}\left(\frac{10}{3} \cdot x\right)$

☐  $\log_2(x) = (\log_{10}(x))^{10/3}$

☐  $\log_2(x) = \frac{10}{3} \cdot \log_{10}(x)$

☐ None of the above

What is the following?

$$\frac{1}{\log_2(100^2)} + \frac{1}{\log_3(100^3)} + \dots + \frac{1}{\log_{100}(100^2)}$$

Enter your answer:

# Logarithm Rules

$$\log(ab) = \log(a) + \log(b)$$

$$\log(a^n) = n\log(a)$$

$$\log_b(a) = 1/\log_a(b)$$

$$\log_b(a) = \log_c(a)/\log_c(b)$$

## Math Circle 5 Math League Intro 9-18-2024 1:50-2:00 and 3:00-3:50

Cyrus, Marc, Rooz, Adam, and Dar with Laura

Laura had asked me to do an intro to math league as all 4 kids are going to try it out. She let me borrow a test book she had. The material is on MathLeague.ORG and can be purchased. I did download the most recent test also.

I worked on some of the problems and prepared a set for both of them to do. Before they started Laura told them what they would do on the preliminary sessions and what was expected of them in terms of behaviour etc.

For Cyrus and Marc I gave them the first 40 questions and 15 minutes they finished in less than 10 and they did almost all correctly. For Rooz and Adam I gave them 19 questions and 10 minutes (Rooz continued a bit more) they also finished before the time was up and also got most of the problems correctly. This part of the test called number Sense has 80 problems each week that they have to do in them in 10 minutes (this is my understanding). This is a challenge even for me! They need to learn and relearn and use a lot of Math tricks for multiplying and dividing finding squares and cubes and square roots and cube roots and finding remainders for dividing large numbers by one digit numbers, changing numbers to different basis, using the Pythagorean theorem and basic algebra identities, sequences and their sums, etc. They need to be good at rounding and estimating also. I made some notes on divisibility that I shared with them. There was a problem with Roman Numerals that they had trouble with as Cyrus and Rooz had not worked with it and Marc and Adam had seen them but still were not comfortable with them. I went over it with them.

Later I also took another part of the test called the Sprint Round with 30 multiple choice questions and this required a lot more thinking and I had to work on at least 10 of them pretty hard and got 4 wrong at least. This will be challenging for all of them in particular for the younger kids.

I think overall this will be a great challenge for all of them irrespective of if they get into the team(s) and I will try to go over all the methods that can help them solve these types of problems. This will be a significant help for them when they get to taking similar tests including SAT later.

7) take 1 to 6 units off to make

the number divisible by seven

Use (a-2b rule)

For example for 14,635 ignore 14

for 625 take 2 away to make if 623

$$62-6=56 \quad R=2$$

8) Do the long division only using

the remainder to find R. Use

the last 3 digits

72,939

939

13

59

3

$$R=3$$

9) take 1 to 8 units to make

the sum of the numbers

divisible by 9

For example for 2357

take 8 units away  $R=8$

Alternatively add 1 unit and  $R=(9-1)=8$

## Divisibility check & Remainder (R)

2) If the number is odd  $R=1$

3) Take 1 or 2 units off to make

the sum divisible by 3

$$R=2$$

For example: 377 take 2 away 375

4) take 1 or 2 or 3 units to make the

last two digits divisible by 4

(Remember the rule for divisibility 4)

(add 2 or 6, even + 0, 4, 8)

For example for 56,939 take 3

away to make it 56,936  $R=3$

5) take 1, 2, 3, or 4 units away to

make the last digit 0 or 5

For example for 694,324 take

4 units away to make it 694,320  $R=4$

6) take 1 to 5 units away to make

the result even with sum of the

number divisible by 3

$$R=5$$

For example for 5261 take 5 away to make it 5256

I continued with some of the basic numbers sense tricks that they can use for the their Math League qualification and also it is good for them to have in their Mental Math knowledge. I also gave them some quick quizzes to practice doing the problems fast but accurately.

I gave them first the cards that I had made based on the draft that I shared with them for finding remainders. I have found that if the cards are nicely made and laminated they pay more attention to them! We discussed the rules in particular for 7 and 11 and also for 8 that I also had a card made for them for divisibility by 8. Then I gave them the quiz that they did in 5 minutes. They finished before time. They got most of the answers but they both had problems with remainders for 7 and 11 that are the hardest.

## Divisibility Check and Finding the Remainder

For 2) If the Number is Odd the remainder is 1.  $R=1$

For 3) Subtract 1 or 2 to make the sum of the digits divisible by 3.  
For example: For 377 subtract 2 to get 375.  $R=2$

For 4) Subtract 1, 2, or 3 to make the last 2 digits divisible by 4. (odd+2,6 - even+0,4,8)  
For example: For 51,939 subtract 3 to from 39 to get 36.  $R=3$

For 5) Subtract 1,2,3, or 4 to make the last digit 0 or 5.  
e.g. for 69,427 subtract 2 to get 69,425.  $R=2$

For 6) Subtract 1 to 5 to make the result even and divisible by 3.  
e.g. For 5263 subtract 1 to get 5262 that is even with sum of digits=15,  $R=1$

For 7) Subtract 1 to 6 to make the result divisible by 7 (a-2b divisible by 7)  
e.g. for 14626 ignore 14 then for 625 subtract 2 to get 623 since  $62-6=56=7 \times 8$   $R=2$

For 8) Subtract 1 to 7 to make the last 3 digits of the result divisible by 8 (e xx div by 8, oxx div by 4 not 8). e.g. for 35,671 subtract 7 from 671 to get 664 that is divisible by 8.  $R=7$

For 9) Subtract 1 or 8 to make the sum of the digits divisible by 9.  
For example: For 36,782 subtract 8 to get 36,774 (sum of digits=27).  $R=8$

For 11) Subtract 1 to 10 to make the alternating sum divisible by 11.  
e.g. for 35,237  $3-5+2-3+7=4$  subtract 4 to get 35,233  $3-5+2-3+3=0$ .  $R=4$

For 12) Subtract 1 to 11 so the result is divisible by 3 and 4.  
e.g. for 3615 subtract 3 to get 3612 sum of digits 12 and 12 is divisible by 4.  $R=3$

### Divisibility Rule for 8: Look at last 3 Digits

For 200,400,800 last 2 digits should be green.

For 100,300,500,700,900 last 2 digits should be red.

the remainder of  $71,410 \div 8$  is 2

the remainder of  $657,651 \div 12$  is 3

Next, I gave them the cards for the 20x20 Multiplication table that had the squares of the 2-digit numbers on the back and went over the fact that they needed to know these results pretty much like the 10x10 multiplication table. We went over the multiplication of one-digit numbers by numbers from 11 to 20 and the squares of numbers from 11 to 19. I also went over the multiplication method for numbers between 11-19 that will help them find these values quickly. I went over the rules and we each asked a few of them.

I also showed them how using the algebraic identity:

$$(a+b)(a-b)=a^2-b^2$$

$$(a+b)(a-b)+b^2=a^2$$

They can find the squares of two-digit numbers mentally much easier. I first made them do the algebra even though they were resisting. Rooz had also walked in, so I made him do it also partially.

For example to find  $58^2$  you can think of it as  $(58-2)(58+2)+4=56 \times 50 + 4 = 2,804$  The trick is to make one of the numbers a multiple of 10 so they can do the multiplication easier in their head and add the square of the number they had to add to find the multiple of 10.

$$(a+b)(a-b) = a(a-b) + b(a-b) = a^2 - ab + ab - b^2 = a^2 - b^2$$

$$a(a-b) + b(a-b) = a^2 - \cancel{ab} + \cancel{ab} - b^2 = a^2 - b^2$$

$$(a+b)(a-b) = a(a-b) + b(a-b) = a^2 - b^2 \quad \text{Rooz}$$

I also talked about the double-digit mental multiplication when the ten-digits are the same or the ones-digits are the same and gave them a short quiz to do. Marc got a little frustrated at the end as this method needs a bit more practice.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

This was a good session and these mental tricks as well as some others that I will teach them should help them in the Math League if they get selected.

Math Circle CMR 7 Math League Continued 10-16-2024 1:55-3:00

Cyrus, Marc, Rooz, and Dar

There was no MC last week because of holiday. We started with a new format with Cyrus, Marc and Rooz and will continue as long as that works. If need be I will have a separate session for Rooz sometimes. Based on the results of this session I think we should be able to continue with it. I will address some of the tactics that they could use for math league competition and beyond but with an emphasis on finding patterns and generalizing from it. Also I will try to get them to discuss how they would solve different problems. We will work on some of the tricks and tip from the Math league book that Laura shared with me.

I First choose a sprint question that I had trouble with and then chose 2 topics: Squares up to 100 and Cubes up to 20.

I started by telling them that they were a team and since Rooz was younger they were to help him along and not give him or each other any trouble. I also told them about the different parts of the test a bit and about the Sprint part that was either a multiple choice or required a written answer with 30 questions.

I showed them the problem and read it for them and asked them to think about it and tell me what they thought the right answer may be. Both Marc and Cyrus after a bit of back and forth chose  $\frac{2}{3}$ , Rooz chose the right answer  $\frac{1}{3}$  (I had come up with  $\frac{2}{3}$  myself when I first looked at the problem. Without telling them what the correct answer was I engaged them in and on how they could go about the finding the correct solution. By starting with  $\frac{1}{2}$  and if  $\frac{1}{2}$  did not work should the answer be more than  $\frac{1}{2}$  or less than  $\frac{1}{2}$ . Some how Marc and Cyrus had not paid attention that  $\frac{1}{2}$  had to be applied to the 30 minutes and not the 15 minutes. After some back and forth I did point out that if  $\frac{1}{2}$  to 30 was biking then Cadi would have covered the whole distance on the bike, so the answer had to be  $\frac{1}{3}$ . I also drew a picture, and I said they should always try to draw on paper if possible and if not in their head. Cyrus and Marc did give a dirty look to Rooz as they were adamant that their answer was correct. I have to be careful that they really become a team;=>

Next, I told them that they were going to learn a method to find squares of numbers from 50 to 60 and use this method to find all the squares of numbers from 10 to 100.

I mentioned again that they would be using the following algebraic identity:

$$(a+b)(a-b)=a^2-b^2$$

$$(a+b)(a-b)+b^2=a^2$$

Rooz wanted to do his method and was making faces, but I got him to use this method and once he saw the pattern he was off and running. I gave them the card that I had made for them, and they got going. Marc finished first and Cyrus was moving much faster, and he said so and Rooz finished right after Cyrus and even followed the pattern for the last row.

| x  | a  | (50+a)(50-a) | Base  | + | a <sup>2</sup> | x <sup>2</sup> |
|----|----|--------------|-------|---|----------------|----------------|
| 50 | 0  | 50x50=2,500  | 2,500 | + | 0              | 2,500          |

Once they were done, we discussed the fact that they could now easily remember (or recompute in their head) any of these squares as they could start with the base of 2,500 and add as many 100s as the 1s digit then add the 1s digit squared to it so for 58<sup>2</sup>

$$58^2 \Rightarrow 2500 \Rightarrow 3300 \Rightarrow 3364$$

Next, I gave them the revised squares table below and encouraged them to find a similar pattern first for 20s then for 30s, 40s etc. They quickly concluded that they could do the same except now instead of adding 100s(50x2) they needed to add 40(20x2) for 20s and 60(30x2) for 30s etc. I asked them to work on this and see how many of these squares they could do in their head by next week. We tried a number of the squares and Rooz came up faster a few times but then confessed that he was looking at the card;=> I think they were impressed as much with the method as much as I was with coming up with it. May be I get the Field Medal for it;=>

| 1s Digit<br>10s Value ↓ | 0      | 1      | 2      | 3      | 4      | 5      | 6      | 7      | 8      | 9      | 10     |

Next, as Cyrus was asking me what was the discovery that I had made between the link between what he did with 3ed degree equation – pascal’s triangle and cubes that I mentioned to him and Rooz briefly on Sunday I started them on a method to find cubes for numbers between 1 and 10 (next week we will do the same exercise with numbers between 10 and 20.

I gave them the template that I had prepared for them and they got started:

| <b>a</b>  | <b>a<sup>2</sup></b> | <b>a<sup>3</sup>=a.a<sup>2</sup></b> | <b>Delta 1</b> | <b>Delta 2</b> | <b>Delta 3</b> | <b>Delta 4</b> |
|-----------|----------------------|--------------------------------------|----------------|----------------|----------------|----------------|
| <b>0</b>  | <b>0</b>             | <b>0x0=0</b>                         |                |                |                |                |
| <b>1</b>  | <b>1</b>             | <b>1</b>                             | 1-0=1          |                |                |                |
| <b>2</b>  |                      |                                      |                |                |                |                |
| <b>3</b>  |                      |                                      |                |                |                |                |
| <b>4</b>  |                      |                                      |                |                |                |                |
| <b>5</b>  |                      |                                      |                |                |                |                |
| <b>6</b>  |                      |                                      |                |                |                |                |
| <b>7</b>  |                      |                                      |                |                |                |                |
| <b>8</b>  |                      |                                      |                |                |                |                |
| <b>9</b>  |                      |                                      |                |                |                |                |
| <b>10</b> |                      |                                      |                |                |                |                |

They kept asking what the deltas were, and I told them that they would find out. Mark was proud to have found that I misspelled Delat3 instead of Delta 3 and of course I said, as usual, I did it on purpose to see if anybody catches it;=> Marc was running ahead a usual but Cyrus and Rooz were keeping up. Both Marc and Rooz had to restart Delta 2 s they went too fast, but they all were impressed that delta 3 became 6 and Delat 4 became 0. They wanted to find some pattern for Delat 1 like it were all primes, but they found that ninety-one was not prime.

Next, I asked them to see what the difference was for the consecutive squares. Cyrus was convinced that this was related to a discovery he had made a few years back about the sum of consecutive step squads being a square. (I have to think about this one) They first said that these will be the primes and quickly everyone got it that it was just the consecutive odd numbers and this is related to the sum of consecutive odd numbers always being a square number. Indeed:

$$1+3+5+\dots+n \text{ is always equal to } ((n+1)/2)^2$$

I will have to review this with them next time also.

It was our best Math Circle ever and both Marc and Cyrus hugged me and said this was the best math Circle ever. In addition, Rooz established himself as a legitimate member of this new Math Circle. We had so many more discussions than usual and they did not even ask for the time once during the session.

## Math Circle 8 Pythagorean Triples 10-23-2024 12:15-1:15

Math Circle CMR 8 Pythagorean Triples 10-23-2024 12:15-1:15

Cyrus, Marc, Rooz, and Dar

I was going to continue with the Math League stuff and in particular do the Cubes from 10-20 and have them workout why the successive difference go to zero. But I saw a video about Pythagorean Triples that was amazing and instead we worked on that. This video was from 3 Blue 1Brown and was called: [All possible Pythagorean triples, visualized](#) and it is a remarkable piece of Mathematics.

I prepared a worksheet for them and discussed the fact that they could use the following formulas to find Pythagorean Triples

$$(a+b)(a-b)=a^2-b^2$$

$$(a+b)(a-b)+b^2=a^2$$

They understood quickly that if one side is an odd number they could find two consecutive numbers that added up to the square of that number. They also came up with some odd numbers of their own and found the other two numbers in the triple.

Next I used the method that Grant had discussed in the video but did not use complex numbers and came up with a version that just has real integers. In short if we have any two numbers  $x > y$  then the following is a Pythagorean triple:

$$x^2 - y^2, 2xy, x^2 + y^2$$

I had shown the video to Rooz and Cyrus once and they saw the magic but I am not sure they understood it all (I did not understand it fully myself and had to watch it again and still they are some stuff that I have to think about more). Never the less they used the method and found that all the triples that they had found can now be found using two numbers  $x$  and  $y$  for example 2, 1 gives the triple 3, 4, 5. They had some trouble with the ones they had come up with but I helped them some and finally Cyrus found that  $a = 2x - 1$ . So  $x = (a + 1)/2$  and in our case here  $y = x + 1$ .

I had them pick a couple of random  $x$  and  $y$  and see that they always got a Pythagorean Triple with any two integers  $x$  and  $y$  (this is truly remarkable).

At this point Mihai and Hugo came and I ran the video for everybody and I think everybody connected with it. Even Rooz that has not worked with imaginary numbers was impressed and I could see the gleam in his eyes.

This was another great Math Circle;=>

| $a=x^2-y^2$ | $b=2xy$ | $c=x^2+y^2$ | $a^2=c^2-b^2=(b+c)(b-c)$         | x  | y  |
|-------------|---------|-------------|----------------------------------|----|----|
| 3           | 4       | 5           | $3^2=5^2-4^2=(5+4)(5-4)=9$       | 2  | 1  |
| 5           | 12      | 13          | $5^2=12+13 \times 1=25$          | 3  | 2  |
| 7           | 24      | 25          | $7^2=24+25 \times 1=49$          | 4  | 3  |
| 9           | 40      | 41          | $9^2=40+41 \times 1=81$          | 5  | 4  |
| 11          | 60      | 61          | $11^2=60+61 \times 1=121$        | 6  | 5  |
| 13          | 84      | 85          | $13^2=84+85 \times 1=169$        | 7  | 6  |
| 15          | 112     | 113         | $15^2=112+113 \times 1=225$      | 8  | 7  |
| 31          | 480     | 481         | $31^2=480+481 \times 1=961$      | 16 | 15 |
| 101         | 5100    | 5101        | $101^2=5100+5101 \times 1=10201$ | 51 | 50 |

| $a=x^2-y^2$ | $b=2xy$ | $c=x^2+y^2$ | $a^2=c^2-b^2=(b+c)(b-c)$       | x  | y  |
|-------------|---------|-------------|--------------------------------|----|----|

| 49          | 440     | 441         | $49^2=440+441 \times 1=8281$   | 46 | 45 |
| 89          | 3160    | 3161        | $89^2=3160+3161 \times 1=7921$ | 45 | 44 |

We started with the visual proof of the Pythagorean Theorem that Cyrus and Marc had seen two years back but was new for Rooz. They each demonstrated it with the material and also we talked about how the the following identities can be seen as a by product of this proof:  
Cyrus also mentioned that we had done the proof for  $a^2 - b^2 = (a+b)(a-b)$  but I did not pursue that as I wanted to show them some of the other proofs.

$$(a+b)^2 = a^2 + b^2 + 2ab.$$

$$(a-b)^2 = a^2 + b^2 - 2ab.$$

They also did some of the other proofs, in particular the one below that came from a Mathaloger youtube video. [Pythagoras twisted squares: Why did they not teach you any of this in school?](#)

They had to mark the two smaller triangles that were the scaled version of the very small triangle by A and B to see that the opposite sides of the rectagle showed  $AA+BB=CC$  or  $A^2+B^2=C^2$ . I helped them a bit but they all got there.

Next they worked on the worksheet that I had prepared for them from the same Mathologer video that showed that instead of squares they can use any triangle or even a half circles or any other shape they would have an equivalent proof as long as these shapes are similar and built on the 3 sides of the right triangle. They had a bit of trouble with half circles as I had not left them enough space for them to put in the coefficients but eventually they did it with help. [This video would be great to watch](#) also.

They had no trouble with the worksheets and even finding the formulas for a, b, and c the sides and hypotenuse and the other sides of the right triangle based on U and V from the last box. Rooz needed a little help but he is doing great and even completed the other work on the sheet first. They saw that this last relation was the same as they had seen in the previous session  $a=V^2-V^2$ ,  $b=2UV$ ,  $c=V^2+U^2$

$$a = \sqrt{v^2 - u^2}$$

$$b = 2uv$$

$$c = \sqrt{v^2 + u^2}$$

(3)

Next they worked on the worksheet for the Pythagorean Triple Tree and we discussed that these boxes will produce all the Primitive Pythagorean Triples exactly once! And in addition, the remarkable fact that the numbers in the boxes seen as fractions will produce all the simplified fractions starting with  $\frac{1}{2}$  and  $\frac{1}{3}$ !

## Pythagorean Triple Tree

R002

Cyrus

## Pythagorean Triple Tree

We also discussed how the radius of inscribed (in circle) and the 3 excscribed (out circles) circles could also be found from box for the 3, 4, 5 triangle and all other right triangles.

This was a great session and they enjoyed it as much as I had enjoyed learning about the Pythagorean Triple Tree and the other facts from the Mathaloger Videos and preparing the worksheets for them.

## Math Circle 10 Fibonacci numbers – Proof by Induction 11-06-2024 1:55 3:25

Cyrus, Marc, Rooz, and Dar

We started with the Fibonacci sequence. I discussed many of the facts about the Fibonacci sequence that they would later watch in the video: [The magic of Fibonacci numbers | Arthur Benjamin | TED](#). Including the fact that the sum of the consecutive Fibonacci numbers become a Fibonacci number (This we actually did later) as well as 5 is the 5<sup>th</sup> Fibonacci number and the 12<sup>th</sup> Fibonacci number is 144 and this does not happen again Cyrus brought this up as we had discussed it before and we wondered if there is a Fibonacci number that is the cube of its order number (we have to research this).

Then I gave them the work sheet that I had prepared for them to see that the sum of squares of the Fibonacci Numbers will be the product of the last number in the sequence and the one after that.  $F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 = F_n \times F_{n+1}$ . They did this pretty quickly and I had them see and write down each product and finally come up with the formula for  $n$ . They did this by comparing it to the rectangles that are produced by the squares of the Fibonacci numbers on their worksheet. Rooz needed a bit more help with the case of  $n$  as this is getting too abstract for him but Cyrus and Marc saw it pretty quickly once they had written all the other numerical products.

Next I explained what the Proof by Induction was and how it worked. Cyrus asked a lot of questions that I am sure Marc and Rooz also had. Finally I just told them to trust me and the Proof by Induction was sort of magical and even seemed like cheating the way it works. Finally I had them do the last step and see that for the case of  $n+1$  the identity will follow because  $F_n \times F_{n+1} + F_{n+1}^2 = F_{n+1}(F_n + F_{n+1})$  and the last term is equal to  $F_{n+2}$  by the basic property of Fibonacci numbers. This needed more explanation on how the factoring worked but I think all 3 of them in particular Cyrus and Marc had an Aha moment when they saw how easily the formula for  $n+1$  jumps out of the formula for  $n$ .

Next, they watched the video: : [The magic of Fibonacci numbers | Arthur Benjamin | TED](#) followed by the video: [The Golden Ratio: Is It Myth or Math?](#) That they enjoyed.

This was a good session I did not get to do many of the things I had prepared for them but I think they all got a good introduction to how the Proof by Induction works. This is a very advanced topic so we spent a lot of time talking about it. Cyrus will not let go until he gets it! Even then at some point I had to ask him to just trust me and he did.

I will do more of the Fibonacci and Proof by Induction for them next session to make sure they really get it.

## Fibonacci Sequence Properties

Rooz

# Proof by Induction

Prove That:

$$\sum_{i=1}^n F_i^2 = F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 = F_n \times F_{n+1}$$

Proof by Induction:

1. Check that it is true for  $n=1$

2. Assume that it is true for  $n$ :

$$F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 = F_n \times F_{n+1}$$

3. Show that it is true for  $n+1$

$$F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 + F_{n+1}^2 = F_{n+1} \times F_{n+2}$$

Use the fact that  $F_{n+2} = F_n + F_{n+1}$  (Definition of Fibonacci Sequence)

$n=1 = 1 \times 1 \checkmark$   $F_1^2 + F_2^2 = F_1^2 + F_2^2 = 1^2 + 1^2 = 2 = F_1 \times F_2 + F_2^2 = F_2 \times F_3$

## Proof by Induction

Rooz

Prove That:

$$\sum_{i=1}^n F_i^2 = F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 = F_n \times F_{n+1}$$

Proof by Induction:

1. Check that it is true for  $n=1$

2. Assume that it is true for  $n$ :

$$F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 = F_n \times F_{n+1}$$

3. Show that it is true for  $n+1$

$$F_1^2 + F_2^2 + F_3^2 + \dots + F_n^2 + F_{n+1}^2 = F_{n+1} \times F_{n+2}$$

Use the fact that  $F_{n+2} = F_n + F_{n+1}$  (Definition of Fibonacci Sequence)

$$1. \forall h = 1 = |x|$$

$$F_1^2 + F_2^2 + \dots + F_n^2 + F_{n+1}^2 = F_{n+1} \times F_{n+2} = F_n \times F_{n+1} + F_{n+1}$$

Work for 1  $\checkmark F_1^2 + F_2^2 + \dots + F_n^2 = F_n \times F_{n+1}$

Assume for n

Prove for n+1

$$F_1^2 + F_2^2 + \dots + F_n^2 + \underbrace{F_{n+1}^2}_{2 \times} = (F_n + F_{n+1})^2$$

$$= F_n \times F_{n+1} + F_{n+1}^2$$

$$= F_{n+1} (F_n + F_{n+1})$$

$$= F_{n+1} F_{n+2}$$

$$5 \times 2 + 2^2 =$$

$$2(5+2)$$

## Math Circle 11 Math League Team Round Strategy 11/13/2024 2:00 to 3:00

Cyrus, Marc, Rooz, Lizzy and Dar

## Math Circle 12 Math League Team Round Strategy 12/11/2024 2:00 to 3:15

Cyrus, Marc, Rooz, Lizzy and Dar

After some discussion of why it was important for them to have a field of expertise and divide the 10 problems, each person attacked what they were best at. For this round this is really a test but by February they should be ready. I had them come up with a tentative list of the type of problems that they were best at. Using this list, I asked them to assign problems for 3 different Team Rounds and eventually they did this in less than 3 minutes. They really should not take more than 2 minutes to do this eventually Also if anyone sees a problem that is familiar to him/her, or they think they can do it easily they should immediately claim it. The goal is to find the easiest problems and do them correctly as fast as possible before moving to harder problems. So even if they get a problem assigned and they see that it too hard they should give it a grade of "0" and move on and let someone else tackle it. Cyrus and Lizzy looked at problems 6-10 and Marc and Rooz looked at problems 1-5.

Cyrus wanted to do a round, so I let them tackle Team Round 11825. I needed to help them with many of the problems, they got the correct answer on several of them after that.

I have made the tables that they can use for the actual Round on Saturday and Cyrus will bring them. They should study the problem assignment table so they can do the first task of assignment as fast as possible.

Each person will attack the problem that they are assigned and will put the answer in the Answer box and give a grade 3 Correct, 2 May be Correct; 1 Maybe; 0 no idea. Problems that do not get a 3 should be reviewed or attacked by someone else and even the 3s should get a quick review to see that the answer is correct (I often solved the problem correct but did not give the exact answer that was Asked for.)

They also must make sure that they get all the answers into the computer in the last 5 minutes.

# Math Circle 13, 14 Math League Exercises etc. 12/19/2024 12/26/2025 2:00 to 3:15

MC 12/19 -26/2024

Cyrus, Rooz, and Dar

Marc was not feeling well, and we had the session with Rooz and Cyrus. We did a round of Number Sense, and I participated. Everyone did well and each of us made a few stupid mistakes!

We also went over the strategies for doing percentage related problems: discounts, taxes and interest.

On 12/26 we did more exercises from Math League test.

| Ratio | Fraction |  |  |  |  | Percent | Decimal |
|-------|----------|--|--|--|--|---------|---------|
| 3:2   | 3/2      |  |  |  |  | 150%    | 1.5     |
| 7:5   | 7/5      |  |  |  |  | 140%    | 1.4     |
| 13:10 | 1 3/10   |  |  |  |  | 130%    | 1.3     |
| 6:5   | 6/5      |  |  |  |  | 120%    | 1.2     |
| 11:10 | 1 1/10   |  |  |  |  | 110%    | 1.1     |
| 1:1   | 1/1      |  |  |  |  | 100%    | 1       |
| 9:10  | 9/10     |  |  |  |  | 90%     | 0.9     |
| 4:5   | 4/5      |  |  |  |  | 80%     | 0.8     |
| 3:4   | 3/4      |  |  |  |  | 75%     | 0.75    |
| 7:10  | 7/10     |  |  |  |  | 70%     | 0.7     |
| 3:5   | 3/5      |  |  |  |  | 60%     | 0.6     |
| 1:5   | 1/2      |  |  |  |  | 50%     | 0.5     |
| 2:5   | 2/5      |  |  |  |  | 40%     | 0.4     |
| 3:10  | 3/10     |  |  |  |  | 30%     | 0.3     |
| 1:4   | 1/4      |  |  |  |  | 25%     | 0.2     |
| 1:5   | 1/5      |  |  |  |  | 20%     | 0.25    |
| 1:10  | 1/10     |  |  |  |  | 10%     | 0.1     |
|       | 0        |  |  |  |  | 0%      | 0       |

You bought a Persian rug for \$4,000 and it's value went up by 15% in one year. How much is your rug worth now?

You bought a car for \$40,000 and they gave you a 20% discount. How much did you pay?

You bought stock and it's value went up by 10% in one year. How much did you pay for the stock?  $X(1.1) = 5,500$   $X = 5,500 / 1.1 = 5,000$   $X = 5,000$

You got an 8% discount on a refrigerator. The price after discount was \$4,140. What was the original price?  $X(.92) = 4,140$   $X = 4,140 / .92 = 4,500$

Math Circle 15 Linear Algebra 1/15/2025 2:00 to 3:15

Cyrus, Marc, Rooz, Dar

I spent the last 4 sessions working on topics from the team competition for Math League. By popular request I will leave that to Laura and Kelly and go back some othe math concepts. We started the [Linear Algebra](#) series based on 3 Blue 1 Brown series by the same name by Grant Sanderson <May he live long and prosper;=> We watched the first video and then they did the exercises on the first worksheet that I had made for them based on what Grant had covered in the video which was a great introduction to vectors and coordinate systems.

All 3 of them got started. I had to help and encourage Rooz that was a little overwhelmed at the beginning. Marc went too fast but he made a mistake with problems 3, 4, and 5. He was a bit discouraged but he corrected his error with my encouragement and finished his work with Cyrus and Rooz. Cyrus went very systematically and slow as usual and finished all the questions. Rooz finished just a little after Cyrus with a little more help from me. All 3 needed a little help with problem 5 and I had to explain it to each one of them. Exercises 1 and 2 covered drawing vectors and finding their sum. Exercises 3, 4, and 5 dealt with scaling the vectors in the first 2 problems and finding the new sums for these vectors.

We discussed also what happened to the final resulting vectors and the fact that it was turned towards the left. We also discussed that vectors A and B and A' and B' are perpendicular to each other.

I was hoping to cover two videos and two worksheets, but this was just right for them and took 1 ¼ hours. This has been a great review for me, and I hope to cover many of the topics in these 15 videos for them now that I have a good understanding of almost every topic;=>.

Name Cyrus Linear Algebra Problems (1)

Date 1/15/15 Draw and mark the following vectors using a black pencil:

$$A \begin{bmatrix} 2 \\ 3 \end{bmatrix} \quad B \begin{bmatrix} 3 \\ -2 \end{bmatrix} \quad C \begin{bmatrix} -2 \\ 2 \end{bmatrix} \quad D \begin{bmatrix} -1 \\ -4 \end{bmatrix}$$

2. Find, draw, and mark the following vectors with **red** pencil.

$$\vec{U} = \vec{A} + \vec{B}$$

$$\vec{P} = \vec{U} + \vec{V}$$

$$\vec{V} = \vec{C} + \vec{D}$$

3. Find, draw and mark the following vectors with black pencil

$$\vec{A}' = 2\vec{A} \quad \vec{B}' = 2\vec{B} \quad \vec{C}' = 3\vec{C} \quad \vec{D}' = 3\vec{D}$$

4. Find, draw and mark the following vector with **red** pencil.

$$\vec{U}' = \vec{A}' + \vec{B}'$$

$$\vec{P}' = \vec{U}' + \vec{V}'$$

$$\vec{V}' = \vec{C}' + \vec{D}'$$

5. Find  $a$  and  $b$  so that  $\vec{P}' = a\vec{U} + b\vec{V}$

$$a=2 \quad b=3$$

Math Circle 16 Linear Algebra 2 1/29/2025 2:00 to 3:15

Cyrus, Marc, Rooz, Dar

We continued the [Linear Algebra](#) series based on 3 Blue 1 Brown series by the same name by Grant Sanderson. We watched the second video, and I also did a few demonstrations for them also. We also covered a bit of the 3ed video that we will cover fully next week. Then they did the exercises on the second worksheet that I had made for them based on what Grant had covered in the 2ed video. This is a great introduction to vectors, matrices and vector spaces. I have started to work on MIT Course on Linear Algebra by Gilbert Strang that is supposed to be the father of Linear Algebra. It is really great for me, and I will extract a lot of the main topics for them. I have also ordered his book.

Everyone did well. Marc went slower and his sheet is great. I encourage and pull Rooz along but he did quite well. Cyrus' work was great as usual. They asked for a challenge and did a rotation of  $Z(2,1)$  something that we go into details next session.

It was one of our best sessions and they did well.

His Final Lecture 2023

## Linear Algebra Problems (2)

Date

1. Find, draw and mark the following new Basis vectors:

$$\vec{U} \begin{bmatrix} 4 \\ 4 \end{bmatrix} \quad \vec{V} \begin{bmatrix} -2 \\ 3 \end{bmatrix}$$

2. Write  $\vec{U}$  and  $\vec{V}$  in terms of the Basis vectors  $\hat{i}$  and  $\hat{j}$

3. Find, draw and mark the sum of  $\vec{U}$  and  $\vec{V}$ :  $\vec{X} = \vec{U} + \vec{V}$

4. Write  $\vec{X}$  as a linear combination of  $\hat{i}$  and  $\hat{j}$  and verify that the scalars that you find are the coordinates of  $\vec{X}$ .

5. Find, draw, and Mark the vector  $\vec{Y} = -\vec{X}$  and write it in terms of basis vectors  $\hat{i}$  and  $\hat{j}$

Cyrus 1/29/25

hand2mind.

$$\begin{aligned}\vec{U} &= 4\hat{i} + 4\hat{j} \\ \vec{V} &= -2\hat{i} + 3\hat{j} \\ \vec{X} &= 2\hat{i} + 7\hat{j} \\ \vec{Y} &= -2\hat{i} + -7\hat{j}\end{aligned}$$

H474071005

$$\begin{aligned} \vec{u} &= 4\hat{i} + 4\hat{j} \\ \vec{v} &= -2\hat{i} + 3\hat{j} \\ \vec{x} &= 2\hat{i} + 7\hat{j} \end{aligned}$$

Math Circle 17 Linear Algebra 3 2/04/2025 2:00 to 3:00

Cyrus, Marc, Rooz, Dar

We continued the [Linear Algebra series based on 3 Blue 1 Brown series](#) by the same name by Grant Sanderson. We watched the third, and as before I also did a few demonstrations for them as I felt it was needed. Then they did the exercises on the third worksheet that I had prepared for them based on what Grant had covered in the 3ed video. This is a great way to understand matrices as translations of vectors. I got the book from Strang MIT lectures and have done 11 sessions and will do them all of them eventually to hunt for good stuff for the kids.

Everyone did well. Marc went slower and but made a mistake but did not get too upset and completed every task greatly. I encouraged and pulled Rooz along, but he did quite well and I believe he gets it. Cyrus' work was methodical and great as usual.

At the end we used Cyrus' computer and mine for them to work on the two Python programs that I had made for them to translate the vectors and shapes. Cyrus and Marc worked together and I worked with Rooz. They liked the programs but they were not as impressed as I thought they would be! I guess I was so excited that I could make programs like that using ChatGPT that I thought they would like it as much;< I am attaching the code that Mihai can put on a computer and have Marc play with it.

It was one of the very good sessions, nevertheless and I think they really see the relation between the Matrix and the transformation that it represents.

## Linear Algebra Problems (3)

1. Find, draw and mark the following new basis vectors in red;

$$\hat{i}' = \begin{bmatrix} 2 \\ 1 \end{bmatrix} \quad \hat{j}' = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

2. Find the transformation matrix  $M = [\hat{i}' \hat{j}']$

$$M = \begin{bmatrix} 2 & -2 \\ 1 & 1 \end{bmatrix}$$

$$\begin{bmatrix} a & c \\ b & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ax+cy \\ bx+dy \end{bmatrix}$$

3. Find, draw and mark the following vectors in black:

$$\vec{U} = \begin{bmatrix} 3 \\ 4 \end{bmatrix} \quad \text{and} \quad \vec{V} = \begin{bmatrix} -2 \\ -5 \end{bmatrix}$$

4. Find, draw and mark the transformed vectors in red:

$$\vec{U}' = 3\hat{i}' + 4\hat{j}' = M \begin{bmatrix} 3 \\ 4 \end{bmatrix}$$
$$\begin{bmatrix} 6 \\ 3 \end{bmatrix} + \begin{bmatrix} -8 \\ 4 \end{bmatrix} = \begin{bmatrix} -2 \\ 7 \end{bmatrix}$$

$$\vec{V}' = -2\hat{i}' + 5\hat{j}' = M \begin{bmatrix} -2 \\ -5 \end{bmatrix}$$
$$\begin{bmatrix} -4 \\ -2 \end{bmatrix} + \begin{bmatrix} 10 \\ -5 \end{bmatrix} = \begin{bmatrix} 6 \\ -7 \end{bmatrix}$$

5. on the transformed coordinate system

verify that  $\vec{U}' = 3\hat{i}' + 4\hat{j}'$  and

Hint find and mark

$$3\hat{i}' \text{ and } 4\hat{j}'$$

$$-2\hat{i}' \text{ and } 5\hat{j}'$$

$$\vec{V}' = -2\hat{i}' + 5\hat{j}'$$

We continued the [Linear Algebra series based on 3 Blue 1 Brown series](#) by Grant Sanderson. We watched the 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> videos, and as before I also did a few demonstrations for them as I felt it was needed and we discussed matrix multiplication and determinants. Then they did the exercises on the 4th worksheet that I had prepared for them based on what Grant had covered in these videos. They learned about matrix multiplication and how it relates to doing 2 successive transformations. They also saw how determinants represented areas related to the parallelogram, rectangle or square formed by the basis vectors and some of the properties of the determinants. In addition, they saw how determinants represented volumes in 3-dimensional space. I am up to lecture 21 out of 35 lectures from the MIT linear algebra course by professor Strang and hunt for good stuff for the kids. I found one about how to analytically calculate the Area of triangles using determinants. that I will give them as a challenge next week.

Everyone did well. I encouraged and pulled Rooz along, and he did quite well, and I believe he gets it. Cyrus' made a great remark about determinants in 3D when they are zero out of the blue which was great recognizing that determinate of a 3x3 matrix being zero could mean that the vectors were on a plane or on a plane as well as all being zero.

At the end I projected what I had done in Python related to their exercise and displayed it on the TV.< I am attaching the code that Mihai can put on a computer and have Marc play with it.>

It was a good and very long session; we started when they were eating, and I am glad that they stayed with it. I feel they are getting a good feel for the basics of Linear Algebra.

## Linear Algebra Problems (4)

Date: 2/12/25

1. Matrix  $B = \begin{bmatrix} 1 & -1 \\ 1 & 2 \end{bmatrix}$  defines a translation.  
Draw & mark the basis vectors  $\hat{i}_B$  and  $\hat{j}_B$  for this matrix.

2. Matrix  $A = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$  defines another translation.  
Draw and mark the basis vectors  $\hat{i}_A$  and  $\hat{j}_B$  for this matrix.

3. Matrix  $M = AB$ . Find  $M$ .

$$M = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 0 & -3 \\ 4 & 2 \end{bmatrix} = \begin{bmatrix} 0 & -3 \\ 4 & 2 \end{bmatrix}$$

4. For Matrix  $M$  draw and mark the basis vectors  $\hat{i}_M$  and  $\hat{j}_M$ .

5. Draw the parallelogram formed by  $\hat{i}_B$  and  $\hat{j}_B$   
a) find the area of this parallelogram.  
b) calculate the determinant of  $B$   
c) Are these two values the same?

6 & 7. Repeat problem 5 for matrices  $A$  and  $M$

8. Verify that:

$$\text{Det}(A) \text{Det}(B) = \text{Det}(M)$$

\* 9. Find  $N = BA$   $N = \begin{bmatrix} 1 & -1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$

No Is  $N = M$ ?  $= \begin{bmatrix} -5 & -3 \\ 3 & 3 \end{bmatrix}$   
yes Is  $\text{Det}(N) = \text{Det}(M)$ ?

Cyrus, Marc, Rooz, Dar

Everyone did well. Cyrus and Marc worked together as Marc had a finger cast and could not write. It really worked well as they were forced to talk to each other and have Cyrus write the answers after they were done discussing (no rush allowed;=). As always, I worked with Rooz and we made good progress even though a lot was new for him like the equation of the line. He really made a great effort to tag along and it is great for him. I will review some of these concepts with him again separately.

It was a very good and very long session. They did not complain and were not even aware that they had put in nearly one hour and twenty minutes! I did get them some vegetable to eat at the start. I continue to feel they are getting a good feel for the basics of Linear Algebra.

Name: ROOZ

Date: \_\_\_\_\_

$$\begin{aligned} x + y &= 3 \\ -x + y &= 1 \end{aligned}$$

# Linear Algebra Problems (5)

## The Column Picture

1. Find the Matrix  $M$  that represents this transformation:

$$[M] \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

2. Using Elimination find  $\begin{bmatrix} x \\ y \end{bmatrix}$  and draw  $\hat{e}_1, \hat{e}_2$  and vectors  $\begin{bmatrix} 3 \\ 1 \end{bmatrix}, \begin{bmatrix} x \\ y \end{bmatrix}$

$$[M | \begin{bmatrix} 3 \\ 1 \end{bmatrix}] = \begin{bmatrix} 1 & 1 & 3 \\ -1 & 1 & 1 \end{bmatrix}$$

$$x=1 \quad x+y=3 \quad \begin{bmatrix} 1 & 1 & 3 \\ 0 & 2 & 4 \end{bmatrix} \quad \begin{aligned} 2y &= 4 \\ y &= 2 \end{aligned}$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$

3. Is this the same as  $\begin{bmatrix} x \\ y \end{bmatrix}$  in Row Picture. Why?

## The Row Picture

1. Write both equations in the form

$$y = mx + a$$

( $m$  is slope,  $a$  is Intercept)

$$y = -x + 3$$

$$y = x + 1 \quad y = 2$$

$$\begin{aligned} -x + 3 &= x + 1 \\ -1 &= 2x \\ x &= -1/2 \end{aligned}$$

2. Draw both lines below and find their intersection:

$$\begin{bmatrix} x \\ y \end{bmatrix} =$$

Name: ROOZ

Date: \_\_\_\_\_

$$2x + y = c$$

$$4x + 2y = d$$

# Linear Algebra Problems (6)

1. For  $C=2$  &  $d=2$  write and draw  $\hat{j}'$  and  $\hat{j}$ .

$$[M] \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix}$$

2. Can you find  $\begin{bmatrix} x \\ y \end{bmatrix}$ ? Why?

$$\begin{bmatrix} 2 & 1 \\ 4 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix} \rightarrow \begin{bmatrix} 2 & 1 & | & 2 \\ 0 & 0 & | & -2 \end{bmatrix}$$

3. For  $C=4$  &  $d=8$  Find  $\begin{bmatrix} x \\ y \end{bmatrix}$ . How many can you find?

$$\begin{bmatrix} 2 & 1 & | & 4 \\ 0 & 0 & | & 0 \end{bmatrix}$$

4. Find the Nullspace of  $M^T = \begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix}$  and draw it  $\begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$

What do you see?

1. For  $C=2$  &  $d=2$  write and draw these lines:

$$y = -2x + 2$$

$$y = 2x + 1$$

2. Do these lines intersect?

3. For  $C=4$  &  $d=8$  write and draw these new lines:

$$y = -2x + 4$$

$$y = -2x + 4$$

4. What do you see?

The Column Picture

1. Find the Matrix  $M$  that represents this transformation:

$$[M] \begin{bmatrix} x \\ y \end{bmatrix} = \vec{b}$$

2. Using Elimination find  $\begin{bmatrix} x \\ y \end{bmatrix}$  and draw  $\vec{e}_1, \vec{e}_2$  and vectors  $\begin{bmatrix} 3 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \end{bmatrix}$

$$[M | \vec{b}] = \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 3 \\ 4 \end{bmatrix} \quad y = 2 \quad x = 1$$

3. Is this the same as  $\begin{bmatrix} x \\ y \end{bmatrix}$  in Row Picture. Why? Yes

because they are two different views that mean the same thing.

The Row Picture

1. Write both equations in the form

$$y = mx + a$$

( $m$  is slope,  $a$  is Intercept)

$$y = -x + 3$$

$$y = x + 1$$

2. Draw both lines below and find their intersection:

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$$

Name: Cyrus & M

Date: 2/26/25

$$\begin{bmatrix} 2 & 1 \\ 4 & 2 \end{bmatrix}$$

$$\begin{aligned} 2x + y &= c \\ 4x + 2y &= d \end{aligned}$$

## Linear Algebra Problems (6)

1. For  $C=2$  &  $d=2$   
write and draw  $\hat{j}'$  and  $\hat{j}$ .

$$[M] \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix}$$

2. Can you find  $\begin{bmatrix} x \\ y \end{bmatrix}$ ? Why?  
No because they are parallel

3. For  $C=4$  &  $d=8$  Find  $\begin{bmatrix} x \\ y \end{bmatrix}$ .  
How many can you find?  
infinitely

4. Find the Nullspace of  $M^T = \begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix}$   
and draw it  $\begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$   
What do you see?

1. For  $C=2$  &  $d=2$  write  
and draw these lines

$$y = -2x + 2$$

$$y = -2x + 1$$

2. Do these lines intersect?  
No

3. For  $C=4$  &  $d=8$  write  
and draw these new lines:

$$y = -2x + 4$$

$$y = -2x + 4$$

4. What do you see?  
I see infinitely answers.

$$4x + 2y = d$$

# Linear Algebra Problems (6)

1. For  $c=2$  &  $d=2$  write and draw  $\hat{j}'$  and  $\hat{j}$ .

$$[M] \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix}$$

2. Can you find  $\begin{bmatrix} x \\ y \end{bmatrix}$ ? Why?

3. For  $c=4$  &  $d=8$  Find  $\begin{bmatrix} x \\ y \end{bmatrix}$ .  
How many can you find?

4. Find the Nullspace of  $M^T = \begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix}$   
and draw it  $\begin{bmatrix} 2 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$   
What do you see?

H474071005

1. For  $c=2$  &  $d=2$  write and draw these lines

$$y =$$

$$y =$$

2. Do these lines intersect?

3. For  $c=4$  &  $d=8$  write and draw these new lines:

$$y =$$

$$y =$$

4. What do you see?

Cyrus, Marc, Rooz, Dar

We continued the [Linear Algebra series based on 3 Blue 1 Brown series](#) by Grant Sanderson. We watched the 8<sup>th</sup> and 9<sup>th</sup> video. This time I had also prepared a college type lecture for them discussing the problem of the meaning of cross product and projection of one vector on the other one the and the incredible fact that according to these two definitions you could multiply 3 irrational numbers and get a digit as a result! I have watched the videos many times myself and finally I had a good understanding of this duality which is intriguing and not easy to grasp. I solved the problem in my sleep last night after thinking about it for nearly two weeks.

I reviewed a little Trig for them and in particular for Rooz before my presentation. The presentation was tricky, but I believe Cyrus and Marc essentially understood what I was describing and Rooz probably just got a whiff of it. Nevertheless, I think they got a chance to see how an original problem arises and they appreciated my enthusiasm about the problem and the solution. Then we watched the two videos, and they worked on the Projection and Dot Product work sheet that I had prepared for them. Finally, they completed the worksheet on calculating the area of triangles using determinants.

I am up to lecture 22 out of 35 lectures from the MIT linear algebra course by professor Strang and hope to finish them soon and go back and study the Book.

Everyone did well. Cyrus and Marc talked together some while doing their work. As always, I worked with Rooz, and we made good progress even though a lot was more difficult for him. He really makes a great effort to tag along, and it is great to see him do that. I will review some of these concepts with him again separately.

It was again a very good and very long session. They did not even complain and were not even aware that they had put in nearly one hour and twenty minutes again! I did get them some vegetables to eat at the start and gave Rooz some rice in the middle. I continue to feel they are getting a good feel for the basics of Linear Algebra. I am also getting a good feel.

We continued the [Linear Algebra series based on 3 Blue 1 Brown series](#) by Grant Sanderson. We watched the 10<sup>th</sup> and 11<sup>th</sup> videos. These videos are amazing! This time also I spent a lot of time mastering the cross product and preparing 3 sheets for them that I also did with them on board. They had to see two ways to find the volume of a parallelopiped and connect this to the meaning of the dot product to find the length of the cross product of 2 vectors. This involved 2 dualities which are really nuanced to get.

First, we watched the first video. Then I worked with them with the 2 work sheets. Next, we watched the second video and finally, we worked on the last worksheet, and I went over the concepts several times to make sure that they got the main connection between the cross product and the volume of an arbitrary parallelopiped made on the 2 original vectors. I tried to use as many numbers as possible instead of symbols to make the understanding easier.

Everyone did well. Cyrus and Marc, I think understood all the nuances and Rooz was at least at 50% so I think this went well as it was quite complicated for me to get and to compose stuff for them that would guide them to the true meaning of cross product of 2 vectors. I worked with Rooz, and we made good progress even though a lot was more difficult for him. He really made a great effort again to tag along, and it is great to see an 81/2 year old get concepts that are difficult even for college students <not mentioning PhDs in Math;=>

It was again a very good session! I did get them some vegetables to eat at the start and gave Rooz some rice in the middle and bread for Marc and grapes for Cyrus. I continue to feel they are getting a good feel for the basics of Linear Algebra. I am also getting a good feeling and feel proud that I can communicate these ideas to them.

6. Find the volume of the rectangular prism made by vector

$$\vec{X} = \begin{bmatrix} 2 \\ 0 \\ 0 \end{bmatrix} \quad \vec{Y} = \begin{bmatrix} 0 \\ 3 \\ 0 \end{bmatrix} \quad \vec{Z} = \begin{bmatrix} 0 \\ 0 \\ 3 \end{bmatrix}$$

18

7. Find the volume of the parallelepiped made by

$$\vec{X} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \quad \vec{V} = \begin{bmatrix} 3 \\ 4 \\ 2 \end{bmatrix} \quad \text{and} \quad \vec{W} = \begin{bmatrix} 3 \\ 5 \\ 4 \end{bmatrix}$$

$$\begin{vmatrix} 1 & 3 & 3 \\ 1 & 4 & 5 \\ 1 & 2 & 4 \end{vmatrix}$$

# Linear Algebra Problems 8-3

Name: Ross

Date: \_\_\_\_\_

$$\vec{P} \begin{bmatrix} p_x \\ p_y \\ p_z \end{bmatrix} \quad \vec{P} \text{ is } \vec{V} \times \vec{W}$$

$$\vec{X} \cdot \vec{P} = \begin{bmatrix} x \\ y \\ z \end{bmatrix} \cdot \begin{bmatrix} p_x \\ p_y \\ p_z \end{bmatrix} = xp_x + yp_y + zp_z$$

$$\text{Volume of the parallelepiped made by } \vec{V}, \vec{W}, \vec{X} = \det \begin{pmatrix} x & 3 & 3 \\ y & 4 & 5 \\ z & 2 & 4 \end{pmatrix}$$

$$\begin{aligned} p_x &= 6 \\ p_y &= -6 \\ p_z &= 3 \end{aligned}$$

$$= x \det \begin{pmatrix} 4 & 5 \\ 2 & 4 \end{pmatrix} - y \det \begin{pmatrix} 3 & 3 \\ 2 & 4 \end{pmatrix} + z \det \begin{pmatrix} 3 & 3 \\ 4 & 5 \end{pmatrix}$$

$$= 6x - 6y + 3z$$

$$\|\vec{P}\| = \sqrt{p_x^2 + p_y^2 + p_z^2} =$$

$$\vec{X} \cdot \vec{P} = \|\vec{X}\| \|\vec{P}\| \cos \theta = h \|\vec{P}\|$$

$$\text{Volume made by } \vec{V}, \vec{W}, \vec{X} = h \times \text{Area of parallelogram made by } \vec{V} \text{ \& } \vec{W}$$
